In this project, I will design a page which use approximately 9 tables (maybe more) to check the shipment in the part of region in US. The tables will contain the information about customers, orders, items, delivery, who delivers the items and uses what equipment. You can find more detail in the ER diagram. For the application, you will able to check who delivers the package and what customer ordered if you need. In the addition, you also can look how many items ordered and package delivered each month. It will have some applications for special cases like checking the information of the employees (who delivers the package) and did they use the right cars to deliver the packages.
